

# Do You Know Your True Response Times During a Disaster?

## Deccan Does, and So Can You.

As an emergency management department, it is your main goal to prepare for a disaster before it occurs. You have an action plan in place to mitigate any damage due to the disaster, and, as the disaster passes, there are lessons learned to better prepare for future occurrences. However, as your department puts these plans in place, how do you know the critical deployment and response decisions you're making are the most efficient?

Custom-built to meet the unique needs of your department based on disasters unique to your region, Deccan International's data-driven software applications help Fire & EMS departments improve their disaster response plans, optimizing resources when disaster strikes.

How do I maintain communications when my CAD system is down during a tornado or cyber-attack?

How do I take performance analytics from a current natural disaster, like a hurricane, to plan for future mitigation, such as moving a station to a new location less prone to flooding?

How do I quickly assess any potential coverage deficits in the regions surrounding a disaster site, such as a bridge collapse or train derailment?

How do I optimize my mutual-aid support during both a mass-planned and unplanned event?

Do I know in real-time my true response coverage capabilities during unexpected environmental conditions, such as a blizzard or wildfire, when my units' roadway speeds might be affected?

What stations or alternate staging sites do I redeploy apparatus to when I need to close a station no longer accessible due to an emergency disaster?

How do I quickly navigate our available road network routes and update my CAD run-orders when dealing with flooding due to a hurricane?

*Don't leave your department's response and deployment decisions to chance when responding during a disaster.
